What date range should I import from Tally?	21
Why does the same amount sometimes need two rows in Transaction Master?	21
What if a voucher relates to more than one project?	21

Can I just delete a wrong entry and retype it?	21
Why is 'Recovered From Old?' separate from 'Flag'?	21
What happens after 11 July 2026 (the Segregation Date)?	21
Do I need Power Query or Pivot Tables to use this workbook?	21
Appendix — Named Ranges Reference	22

Part 1 — Overview

1.1 Purpose of This Manual

This manual explains the segregation workbook completely — every sheet, every column, every formula, and every workflow — for whoever needs to build on it, audit it, extend it, or troubleshoot it. If you only need to know how to enter a daily voucher, the shorter 'Data Entry Manual' is the better starting point; this document is the full reference sitting behind it.

1.2 The Business Situation, in Full

Until 31 December 2025, one company existed: Appletree Interiors ('the Old Company'). On 1 January 2026, a new joint-venture company was incorporated — Appletree Interiors Pvt Ltd ('the New Company') — owned 50% by Appletree and 50% by Stories.

Both companies continued to record transactions in the same Tally books from 1 January 2026 until 11 July 2026 (the mixed-books period). The workbook exists to unwind that mixed period into two fully independent sets of books, with a complete audit trail back to the original voucher.

The seven governing rules

#	Rule	What it means in practice
1	Ongoing projects (as on 31-Dec-2025) belong to the Old Company	Revenue, receivables, customer advances and profit on those specific projects are booked to the Old Company, even though the New Company may be doing the physical execution.
2	New Company is an execution agency only	It does not own the ongoing projects — it only builds them on the Old Company's behalf.
3	Execution is at actual cost only	No markup, management fee, or overhead recovery is charged by the New Company for executing Old Company projects.
4	All office overhead from 1-Jan-2026 belongs to the New Company	Rent, salaries, electricity, internet, fuel, marketing, professional fees, vehicle running, software, printing, factory overhead — 100% New Company, zero exceptions, zero allocation back to the Old Company.
5	Only direct project cost is recoverable from the Old Company	Material, site labour, subcontract, transport and other project-specific costs the New Company pays on the Old Company's behalf can be billed back at cost. Overhead never can.
6	Stock transferred Old → New is a sale/purchase pair	Booked as an Old Company stock sale and a mirrored New Company stock purchase, at the same value, no markup.
7	11 July 2026 is the segregation date	From this date the two companies' books must be fully independent.

Why this matters for the workbook's design:

Rule 4 means SHARED transactions should be rare by design — almost everything has a clear home once you know whether it's overhead (always New) or project-related (Old, if the project is on the pre-2026 list).

Rule 5 is why the workbook tracks 'Recovered From Old?' separately from the flag — a cost can be flagged OLD (it belongs to the Old Company) while still being physically paid out of the New Company's bank, creating an intercompany balance until it's recovered.

1.3 What the Workbook Produces

Once transactions are entered and flagged, the workbook automatically produces, separately for each company:

- Trial Balance
- Profit & Loss
- Balance Sheet
- Receivables and Payables, split by party
- Bank and Cash reconstruction
- GST position
- Stock transfer record
- Project cost recovery status
- Intercompany balance

Plus a Reconciliation Dashboard that checks all of the above for consistency and flags anything that needs attention before the books are signed off as fully separated.

Part 2 — Workbook Map

The workbook has 27 sheets. This table is your at-a-glance index; Part 3 covers every sheet in full detail, in the same order.

Sheet	Name	Category	Who edits it
01	Settings	Control	Accounts / Admin
02	Import DayBook	Raw import	Accounts (paste from Tally)
03	Import Ledger	Raw import	Accounts (paste from Tally)
04	Import TrialBalance	Raw import	Accounts (paste from Tally)
05	Import Stock	Raw import	Accounts (paste from Tally)
06	Import Receivables	Raw import	Accounts (paste from Tally)
07	Import Payables	Raw import	Accounts (paste from Tally)
08	Import BankBook	Raw import	Accounts (paste from Tally)
09	Import CashBook	Raw import	Accounts (paste from Tally)
10	Chart of Accounts	Control	Accounts
11	Transaction Master	Engine	Data entry staff + Accounts
12	Intercompany Ledger	Auto report	Read only (Accounts reviews)
13	Old Company TB	Auto report	Read only
14	New Company TB	Auto report	Read only
15	Old Company P&L	Auto report	Read only
16	New Company P&L	Auto report	Read only
17	Old Company Balance Sheet	Auto report	Read only (one manual link — see 3.17)
18	New Company Balance Sheet	Auto report	Read only (one manual link — see 3.18)
19	Bank Reconstruction	Auto report + input	Accounts enters opening/actual balances
20	Cash Reconstruction	Auto report + input	Accounts enters opening/actual balances
21	Stock Transfer	Schedule	Accounts
22	Project Cost Recovery	Auto report	Read only
23	Receivable Split	Auto report	Read only
24	Payable Split	Auto report	Read only
25	GST Reconciliation	Auto report	Read only
26	Adjustment Journals	Manual register	Accounts
27	Reconciliation Dashboard	Control panel	Read only — review before sign-off

The one rule that makes all of this work:

Sheet 11 (Transaction Master) is the only place data is entered day to day. Every other report sheet reads from it live via formulas. Change a Flag in sheet 11, and every Trial Balance, P&L, Balance Sheet, and the Dashboard updates automatically.

Part 3 — Sheet-by-Sheet Reference

Every sheet is covered here in the order it appears in the workbook. Each entry explains the sheet's purpose, exactly what each column/field does, how it connects to other sheets, and anything you need to watch out for.

Sheet 01 — Settings

The control panel for the whole workbook. Everything else refers back to values stored here.

Sections on this sheet

Section	Contents	Notes
Company Names	Old Company name, New Company name, ownership split	Free text — used for labels only, doesn't drive formulas
Key Dates	Cut-off (31-Dec-2025), incorporation (1-Jan-2026), mixed-period start/end, Segregation Date (11-Jul-2026)	The Segregation Date cell is named SEG_DATE and highlighted yellow
Opening Balance	Total value of ongoing projects as on 31-Dec-2025 (₹12,586,031)	A single reference figure — the real detail lives in the Old Projects Master table below it
Old Projects Master	One row per ongoing project: Project Name, Customer, Value as on 31-Dec-2025, Status	This table is the single source of truth for which projects are 'Old'. Every Old/New Project? formula in Transaction Master checks against it.
GST Rates	Exempt, 5%, 12%, 18%, 28%	Reference only
Allocation Rules	Plain-text restatement of Rules 1–7	Documentation only, not a formula input

Named range created here:

OLD_PROJECTS — points at the Project Name column of the Old Projects Master table. Every project-matching formula in the workbook uses this name rather than a hardcoded range, so extending the project list automatically feeds every downstream sheet.

If you add a new ongoing project partway through the year:

Add it as a new row in the Old Projects Master table on this sheet FIRST. Only then will Transaction Master correctly recognise it as an Old Project.

Which dates from Tally actually need to be pulled:

See section 'What date range to export from Tally' under Sheets 02–09 (Import Sheets) below — in short, an opening snapshot as on 31-Dec-2025, plus the full transaction range 01-Jan-2026 to 11-Jul-2026.

Sheets 02–09 — Import Sheets

Eight sheets, one per Tally report, used purely as raw paste zones. None of them contain formulas, and none of them feed other sheets automatically — they exist so the original exported data is kept intact, unedited, and auditable alongside the processed data in Transaction Master.

What date range to export from Tally

There are two separate pulls, not one — an opening snapshot and a transaction range.

Pull	Date / Range	What it's for	Feeds
1. Opening snapshot	As on 31-Dec-2025 (a single cut-off date, not a range)	The last position before the mixed-books period began — opening Trial Balance, opening Stock, and opening Receivables/Payables	01 Settings (Old Projects Master values), the Opening Balance rows in 19/20 Bank & Cash Reconstruction, and as the opening figures behind 13/14 Trial Balance if you want opening + movement rather than movement-only
2. Transaction range	01-Jan-2026 to 11-Jul-2026 (the mixed-books period, per Rule 7 / Settings sheet)	Every voucher that needs to be classified OLD / NEW / SHARED	02 Import DayBook, 03 Import Ledger, 08 Import BankBook, 09 Import CashBook — then re-keyed into 11 Transaction Master

Import sheet	Tally report to run	Date range to use
02 Import DayBook	Day Book	01-Jan-2026 to 11-Jul-2026
03 Import Ledger	Ledger report, per ledger	01-Jan-2026 to 11-Jul-2026
04 Import TrialBalance	Trial Balance	As on 31-Dec-2025 (opening) — pull a second one as on 11-Jul-2026 if you want a closing-position cross-check
05 Import Stock	Stock Summary	As on 31-Dec-2025 (opening), plus movement through 11-Jul-2026
06 Import Receivables	Bills Receivable / Outstanding	As on 31-Dec-2025 (opening), then updated through 11-Jul-2026
07 Import Payables	Bills Payable / Outstanding	As on 31-Dec-2025 (opening), then updated through 11-Jul-2026
08 Import BankBook	Bank Book	01-Jan-2026 to 11-Jul-2026 (opening balance entered separately in sheet 19)
09 Import CashBook	Cash Book	01-Jan-2026 to 11-Jul-2026 (opening balance entered separately in sheet 20)

One thing to confirm with Accounts before pulling data:

Whether 11-Jul-2026 itself is inclusive (the segregation date's own vouchers are still part of the mixed period and belong in this workbook) or is meant to be the first day of fully independent books (in which case only pull transactions through 10-Jul-2026, and anything dated 11-Jul-2026 onward goes straight into each company's new standalone books instead). This workbook currently treats 11-Jul-2026 as the last day of the mixed period — confirm this matches how Tally vouchers are actually being dated.

Don't pull anything before 1-Jan-2026 or after 11-Jul-2026 into this workbook:

Anything before 1-Jan-2026 is already the Old Company's clean, unmixed history — it only matters here as the opening balance snapshot, not as individual transactions.

Anything after 11-Jul-2026 should be going directly into each company's own independent books, not into this segregation workbook at all.

Sheet	Tally report to export	Typical columns
02 Import DayBook	Day Book (all vouchers)	Date, Voucher No, Voucher Type, Ledger, Party, Narration, Debit, Credit, Amount, GST Amount, Reference
03 Import Ledger	Any individual ledger report	Ledger Name, Group, Date, Particulars, Voucher Type, Debit, Credit, Balance
04 Import TrialBalance	Trial Balance	Ledger Name, Group, Opening Dr/Cr, Debit, Credit, Closing Dr/Cr
05 Import Stock	Stock Summary	Item Name, Group, Unit, Opening/Inward/Outward/Closing Qty & Value
06 Import Receivables	Bills Receivable / Outstanding	Customer, Voucher No, Date, Due Date, Bill Amount, Amount Received, Balance Due, Project
07 Import Payables	Bills Payable / Outstanding	Supplier, Voucher No, Date, Due Date, Bill Amount, Amount Paid, Balance Due, Project
08 Import BankBook	Bank Book	Date, Bank Ledger, Voucher No, Particulars, Voucher Type, Debit (Deposit), Credit (Withdrawal), Balance
09 Import CashBook	Cash Book	Date, Voucher No, Particulars, Voucher Type, Debit (Receipt), Credit (Payment), Balance

How to use these sheets:

In Tally: Gateway of Tally > Display/Reports > the relevant report > Export > Excel.

Paste as VALUES starting at the row directly under the header — never paste formulas from Tally exports.

These sheets are reference/backup only. They are what you'd hand an auditor to prove the Transaction Master was built from real data — they are not read by any other sheet's formulas.

Sheet 10 — Chart of Accounts

Every ledger used anywhere in Tally must have exactly one row here. This is the second control table the whole workbook depends on (alongside the Old Projects Master).

Column	Purpose
Ledger Name	Must match the Ledger column in Transaction Master exactly, character for character
Group	The Tally group the ledger sits under — for reference
Nature	Asset / Liability / Income / Expense — high-level accounting nature
Classification	The specific bucket used by formulas: Income, Direct Cost, Indirect Cost, Asset, Liability, Bank, Cash, Stock, GST, Loan, Capital, Intercompany
Default Company Assignment	Old Company / New Company / Split by Flag / Both — tells the Suggested Flag formula in Transaction Master which way to lean
Overhead? (Y/N)	Y for every office-running-cost ledger. Drives the Adjustment Required? check — an overhead ledger flagged OLD is always a rule violation.
Notes	Free text — cite the rule that applies, for anyone reviewing later

Named ranges created here:

COA_LEDGER, COA_CLASS, COA_COMPANY, COA_OVERHEAD — used throughout Transaction Master and the report sheets to look up a ledger's classification, default company, and overhead status.

If a voucher uses a ledger not yet listed here:

Add the ledger as a new row before entering the transaction. Otherwise the Adjustment Required?, Suggested Flag, and TB/P&L/BS formulas for that ledger will not work, and the Dashboard's 'Missing Ledgers' check will flag it.

Sheet 11 — Transaction Master (the engine)

This is the single sheet that everything else is calculated from. One row per ledger leg of one voucher. It is designed to scale to 100,000+ rows.

Full column reference

Col	Field	Type	What it does
A	Date	Manual	Voucher date
B	Voucher Number	Manual	Must be identical across every leg of the same voucher — this is what the balance check groups by
C	Voucher Type	Manual	Purchase / Payment / Receipt / Sales / Journal, etc.
D	Ledger	Manual	Must exactly match a row in Chart of Accounts
E	Party	Manual	Customer/supplier/vendor name
F	Narration	Manual	Description
G	Debit	Manual	Debit amount, if any
H	Credit	Manual	Credit amount, if any
I	Amount	Formula	=Debit–Credit, net signed value
J	GST	Manual	GST amount on this leg
K	Project	Manual	Must exactly match Old Projects Master if project-related; blank if not project-specific
L	Customer	Manual	Used by the Receivable Split sheet
M	Supplier	Manual	Used by the Payable Split sheet
N	Payment Mode	Manual (dropdown)	Bank / Cash / Credit
O	Bank	Manual	Bank ledger name used, if Payment Mode = Bank
P	Cash	Manual	Cash ledger name used, if Payment Mode = Cash
Q	Old Project?	Formula	Yes/No/N-A — matches Project (col K) against OLD_PROJECTS
R	New Project?	Formula	The inverse of Q, or N/A if Project is blank
S	Flag	Manual (dropdown)	OLD / NEW / SHARED — the single most important field in the workbook
T	Adjustment Required?	Formula	Yes if Flag = SHARED, or an overhead ledger is flagged OLD, or income on an Old project is flagged NEW
U	Recovered From Old?	Manual (dropdown)	Yes / No / Pending / N-A — tracks whether a direct cost has actually been billed back to the Old Company
V	Suggested Flag (QA)	Formula	The system's own recommendation, from Chart of Accounts + project match — compare against column S
W	Remarks	Manual	Free text notes, especially for anything unusual
X	Voucher Balanced?	Formula	Yes if total Debit = total Credit across every row sharing this Voucher Number

How the formula columns actually work

Amount (column I):

```
=IF(OR(G6<>"",H6<>""),G6-H6,"")
```

Old Project? (column Q) — checks the Project cell against the OLD_PROJECTS named range:

```
=IFERROR(IF(K6="", "N/A", IF(ISNUMBER(MATCH(K6, OLD_PROJECTS, 0)), "Yes", "No")), "N/A")
```

New Project? (column R) is simply the logical opposite of Q when a project is named.

Adjustment Required? (column T) — the rule-violation check, in plain terms:

- Turns Yes if Flag = SHARED (always needs review).
- Turns Yes if an overhead ledger (Overhead?=Y in Chart of Accounts) is flagged OLD — this would violate Rule 4.
- Turns Yes if an Income ledger is flagged NEW while Old Project?=Yes — this would violate Rule 1.
- Otherwise No.

The actual formula:

```
=IF(S6="SHARED", "Yes", IF(AND(INDEX(COA_OVERHEAD, MATCH(D6, COA_LEDGER, 0))="Y", S6="OLD"), "Yes", IF(AND(INDEX(COA_CLASS, MATCH(D6, COA_LEDGER, 0))="Income", S6="NEW", Q6="Yes"), "Yes", "No")))
```

Suggested Flag (column V) — recommends OLD or NEW based on the ledger's Default Company Assignment in Chart of Accounts, falling back to the project match if the ledger is marked 'Split by Flag'.

Voucher Balanced? (column X) — sums Debit and Credit across every row with the same Voucher Number and confirms they're equal:

```
=IF(ROUND(SUMIF(TXN_VNO, B6, TXN_DEBIT) - SUMIF(TXN_VNO, B6, TXN_CREDIT), 2)=0, "Yes", "No")
```

Conditional formatting on this sheet:

Adjustment Required? = Yes → entire cell highlighted red.

Flag ≠ Suggested Flag → Flag cell highlighted amber, as a QA prompt (not an error — sometimes you deliberately override the suggestion).

Golden rule — double-entry:

A real voucher normally touches two or more ledgers. Enter every leg as its own row, all sharing the same Voucher Number. Voucher Balanced? and the Trial Balances only reconcile once every leg is present.

Named ranges created here (used throughout the workbook):

TXN_DATE, TXN_VNO, TXN_LEDGER, TXN_PARTY, TXN_DEBIT, TXN_CREDIT, TXN_AMOUNT, TXN_GST, TXN_PROJECT, TXN_CUSTOMER, TXN_SUPPLIER, TXN_PAYMODE, TXN_BANK, TXN_CASH, TXN_OLDPROJ, TXN_NEWPROJ, TXN_FLAG, TXN_ADJ, TXN_RECOV, TXN_SUGFLAG, TXN_BAL — each one is the full column, sized for 100,000 rows.

Sheet 12 — Intercompany Ledger

Auto-generated. Tracks what the New Company is owed for funding Old Company project costs, per Rules 3 and 5.

Row	What it calculates
Direct project cost incurred by New Co bank/cash for Old Co projects	SUMIFS of Debit where Flag=OLD, Old Project?=Yes, and the Bank/Cash column mentions 'New Co'
Less: Amount already recovered/reimbursed	SUMIFS of Debit where Recovered From Old?=Yes and Old Project?=Yes
Net Intercompany Receivable	The difference — this is what the New Company is currently owed

Where this feeds:

This net figure appears as an asset line in both the Old Company Balance Sheet (as a payable/asset depending on sign) and the New Company Balance Sheet (sheets 17–18), so the two balance sheets always net to a consistent intercompany position.

Assumption to check:

The Bank/Cash text match assumes your bank ledger names contain 'New Co' (e.g. 'HDFC Bank - New Co'). If your actual ledger names differ, update the match text in this sheet's formulas to suit.

Sheets 13–14 — Trial Balance (Old / New)

Identical structure, one for each company. Every ledger from the Chart of Accounts appears as a row, with Debit and Credit summed from Transaction Master, filtered to that company's Flag.

Debit formula (Credit follows the same pattern):

```
=SUMIFS(TXN_DEBIT, TXN_LEDGER, A6, TXN_FLAG, "OLD")
```

(sheet 14 uses the same formula with "NEW" in place of "OLD")

A Total row sums both columns, and a Difference row (Total Debit – Total Credit) should read exactly zero once every voucher's legs are fully entered and correctly flagged. This Difference cell is what the Dashboard checks.

Why it might NOT be zero yet:

A voucher has only one leg entered so far (see the Golden Rule on sheet 11).

A SHARED transaction hasn't been resolved into an adjustment journal yet (sheet 26).

A ledger is missing from the Chart of Accounts, so its amounts aren't being picked up correctly.

Sheets 15–16 — Profit & Loss (Old / New)

Pulls only ledgers classified Income or Expense in the Chart of Accounts, filtered to that company's Flag.

- Income section: Credit – Debit per ledger (a net credit balance is income).
- Expense section: Debit – Credit per ledger (a net debit balance is an expense).
- Total Income, Total Expenses, and Net Profit/(Loss) = Total Income – Total Expenses, highlighted yellow.

Sanity check specific to this workbook:

Because Rule 4 pushes all overhead to the New Company, the New Company P&L will normally show most of the expense lines, while the Old Company P&L should show mainly the ongoing projects' revenue and direct cost recovered — a New Company P&L with zero overhead, or an Old Company P&L with rent/salary expenses, is a sign something is flagged incorrectly.

Sheets 17–18 — Balance Sheet (Old / New)

Pulls Asset, Bank, Cash, Stock ledgers into the Assets section, and Liability, Loan, Capital ledgers into the Liabilities & Capital section, filtered to that company's Flag, plus the Intercompany Balance from sheet 12.

The one manual step on these two sheets:

Each sheet has a line 'Add: Current Period Profit/(Loss)' left as a placeholder (blue, value 0) with a cell comment. Link it to the matching P&L sheet's 'NET PROFIT / (LOSS)' cell once you know its row (it depends on how many ledgers are listed in the Chart of Accounts) — for example =''15 Old Company P&L'!B18'. This is the only manually-wired link left in the whole report chain, because the P&L's own row count grows or shrinks as ledgers are added.

The final check row on each sheet — Total Assets minus Total Liabilities & Capital — should read zero once that link is made and every voucher is fully entered.

Sheets 19–20 — Bank / Cash Reconstruction

Opening Balance + Receipts – Payments = Closing Balance, calculated independently for each company, side by side.

Row	Source
Opening Balance	Manual entry — the true, audited balance at the start of the mixed period
Total Receipts	SUMIFS of Debit where Flag matches the company and the Bank/Cash column is non-blank
Total Payments	SUMIFS of Credit, same filter
Closing Balance (computed)	Opening + Receipts – Payments
Actual Book/Statement Closing	Manual entry — from sheet 08/09 import or the real bank statement
Difference	Computed – Actual. Must be zero.

If the Difference isn't zero:

Check for vouchers with the wrong Bank/Cash ledger text, vouchers missing a Flag, or a wrong Opening Balance entry.

Sheet 21 — Stock Transfer

Implements Rule 6: the raw material stock physically moved from the Old Company to the New Company is recorded here as a schedule (Item, Qty, Unit, Rate, Value = Qty × Rate).

How this connects to Transaction Master:

The total value calculated here must be entered TWICE into Transaction Master, under the same Transfer Voucher Number: once as the Old Company's stock sale (credit Raw Material Stock, debit Intercompany, Flag=OLD) and once as the New Company's stock purchase (debit Raw Material Stock, credit Intercompany,

Flag=NEW). This sheet itself does not post anything automatically — it is the supporting schedule that the journal entries in sheet 11 must match.

Sheet 22 — Project Cost Recovery

One row per Old Company project (matching the Old Projects Master exactly), breaking direct cost into Material / Labour / Transport / Subcontract, each pulled from Transaction Master by ledger name and project.

`=SUMIFS(TXN_DEBIT, TXN_PROJECT, A6, TXN_LEDGER, "Site Material Purchase")`

Total Direct Cost sums those four columns. Recovered sums only the vouchers marked Recovered From Old? = Yes. Pending Recovery = Total – Recovered — this is the amount that still needs to be billed from the New Company to the Old Company.

Extending this sheet:

If you add more direct-cost ledger types to the Chart of Accounts (e.g. a new 'Site Fabrication' ledger), copy the SUMIFS pattern into a new column here so it's captured in the recovery tracking.

Sheets 23–24 — Receivable / Payable Split

One row per customer (sheet 23) or supplier (sheet 24), with separate Old Company and New Company balance columns, computed from the Sundry Debtors / Sundry Creditors ledger filtered by party and Flag.

What to watch for:

Per Rule 1, a customer tied to an ongoing project should show their entire balance under 'Old Company' — any amount appearing under 'New Company' for that same customer is worth investigating.

Sheet 25 — GST Reconciliation

Output GST (from the Sales ledger) and Input GST (from the Material Purchase ledger), split Old vs New, with a Net GST Payable / (Credit) row for each company.

Important:

This sheet is for internal reconciliation only. Once the two companies' books are independent (post 11-Jul-2026), each must file its own GSTR return through the normal GST portal process — this sheet does not replace that filing.

Sheet 26 — Adjustment Journals

A manual register for every SHARED voucher and every row where Transaction Master shows Adjustment Required? = Yes. Nothing here is automatic — every line is a reviewed, human decision, which is what keeps the segregation audit-ready.

Recommended workflow

1. Filter Transaction Master (sheet 11) by Adjustment Required? = Yes, or Flag = SHARED.
2. For each one, log it here: the original Voucher Number, the ledger, a plain description of the problem, and a recommended split or reclassification.
3. Get it approved (Approved By column) and mark Status.

- Only once Status = Posted, create a NEW dated correcting entry in Transaction Master reflecting the fix. Never edit the original row — this preserves the audit trail from original entry, through review, to correction.

Sheet 27 — Reconciliation Dashboard

The single-page control panel. Every check should read zero (or the expected value) before the segregation is signed off.

Check	Reads from	Good result
Old/New Company TB Difference	Sheets 13/14	0
Old/New Balance Sheet Check	Sheets 17/18 (after manual P&L link is made)	0
Bank/Cash Difference — Old/New	Sheets 19/20	0
Receivable/Payable Totals	Sheets 23/24	Cross-check vs Trial Balance
Net GST Payable — Old/New	Sheet 25	For information
Net Intercompany Receivable	Sheet 12	Trends to 0 as recoveries are billed and paid
Missing Flags	Sheet 11	0
Unbalanced Vouchers	Sheet 11	0 (once every leg of every voucher is entered)
Duplicate Voucher Lines	Sheet 11	0
Negative Stock	Sheet 05	0
Rows Needing Adjustment	Sheet 11	Should trend to 0 as sheet 26 clears the backlog
Flag ≠ Suggested Flag (QA)	Sheet 11	Review each — may be an intentional override
Missing Ledgers	Sheets 10/11	0

Conditional formatting:

Difference cells shaded green when exactly 0, red when the absolute value exceeds 0.01 — a quick visual scan tells you if the books are ready.

A note on Pivot Tables and Power Query:

These require an interactive Excel session and are not generated by an automated build. Every schedule in this workbook instead uses live SUMIFS/INDEX-MATCH formulas that update the moment Transaction Master changes — functionally the same 'change one thing, everything updates' behaviour. If you want ad-hoc slicing on top, insert a native Excel PivotTable directly off the 'tbl_Txn' table (Insert > PivotTable) — it's already structured as a proper Excel Table for this.

Part 4 — End-to-End Workflows

4.1 Daily Data Entry Workflow

5. Open sheet 11 Transaction Master and go to the first blank row.
6. Enter every leg of each voucher (columns A–P), keeping the Voucher Number identical across all legs of the same voucher.
7. Set the Flag (OLD / NEW / SHARED) for each row.
8. Set Recovered From Old? where relevant (direct project costs only).
9. Check the Adjustment Required? and Voucher Balanced? columns for that day's entries — resolve or escalate anything flagged.

4.2 Weekly Review Workflow (Accounts)

10. Open sheet 27 Reconciliation Dashboard and scan for any non-zero, non-green results.
11. For Unbalanced Vouchers or Missing Flags: filter sheet 11 and correct directly (these are data-entry completeness issues, not judgment calls).
12. For rows with Adjustment Required? = Yes or Flag = SHARED: work through sheet 26 Adjustment Journals per the workflow in section 3 above.
13. For Flag ≠ Suggested Flag mismatches: review each — confirm it's an intentional, justified override, or correct it.

4.3 Month-End Close Workflow

14. Confirm all vouchers for the month are entered and balanced (Dashboard: Unbalanced Vouchers = 0).
15. Clear the Adjustment Journals backlog — no Pending Review items older than the month being closed.
16. Enter that month's actual bank and cash statement closing balances into sheets 19–20 and confirm the Difference rows are zero.
17. Update the Balance Sheet's manual Net Profit/(Loss) link (sheets 17–18) if the P&L layout changed.
18. Review sheet 22 Project Cost Recovery and raise recovery invoices from the New Company to the Old Company for anything showing Pending Recovery.
19. Re-check the full Dashboard. Every difference should read zero before the month is considered closed.

4.4 Handling a SHARED Transaction

20. Enter it in Transaction Master with Flag = SHARED (this is a valid, expected placeholder — not an error).
21. Log it in sheet 26 Adjustment Journals with a recommended split and the reasoning.
22. Once approved, post a new correcting entry in Transaction Master (never edit the SHARED row itself) that reclassifies the amount to OLD or NEW, or splits it across both as two separate rows.

4.5 Handling a Stock Transfer

23. Record the physical transfer in sheet 21 Stock Transfer (item, qty, rate — value is calculated).

24. Post the matching journal pair in Transaction Master: Old Company stock sale (Flag=OLD) and New Company stock purchase (Flag=NEW), same Transfer Voucher Number, same value, no markup.

4.6 Handling Project Cost Recovery Billing

25. Check sheet 22 for any project showing Pending Recovery > 0.
26. Raise an at-cost invoice from the New Company to the Old Company for that amount.
27. Once paid, go back to the relevant rows in Transaction Master and change Recovered From Old? from Pending to Yes.

Part 5 — Colour & Formatting Conventions

Colour / style	Meaning
Blue text	A manual input — type here
Green text	A formula/link to another cell — do not overtype
Yellow fill	A key figure to watch (e.g. Segregation Date, Net Profit/Loss, final check cells)
Red fill (Transaction Master)	Adjustment Required? = Yes on that row
Amber fill (Transaction Master, Flag column)	Flag ≠ Suggested Flag — a QA prompt, not necessarily an error
Green fill (Dashboard)	That check currently reads exactly zero — good
Red fill (Dashboard)	That check has a non-zero difference — needs investigation
Navy header row	Standard column header styling across every sheet

Part 6 — Troubleshooting

Symptom	Likely cause	Fix
Trial Balance Debit ≠ Credit	A voucher has only one leg entered	Find the Voucher Number in sheet 11 where Voucher Balanced? = No and add the missing leg(s)
A formula cell shows blank/0 when you expect a value	The Ledger or Project text doesn't exactly match Chart of Accounts / Old Projects Master	Check for extra spaces, different capitalisation, or a missing entry in sheet 10 or sheet 01
Dashboard 'Missing Ledgers' > 0	A ledger used in Transaction Master isn't listed in Chart of Accounts	Add the ledger to sheet 10 with its correct Classification, Company Assignment and Overhead flag
Dashboard 'Negative Stock' > 0	A stock item's Opening or Closing Qty is negative in sheet 05	Check the Tally stock export for that item — likely a data entry or timing issue
Bank/Cash Difference isn't zero	Wrong opening balance, a voucher with the wrong Flag, or inconsistent Bank/Cash ledger naming	Re-check the opening balance entered, and that bank ledger names are typed identically everywhere
A cell shows #NAME? or #REF!	A named range was broken (e.g. a sheet was renamed) or a function isn't supported by your Excel version	Check Formulas > Name Manager for broken names; avoid renaming the numbered sheets
New Company P&L shows no overhead at all	Overhead vouchers have been flagged OLD or SHARED by mistake	Filter sheet 11 for those ledgers and correct the Flag to NEW

Part 7 — Roles & Responsibilities

Role	Responsibilities
Data Entry Staff	Enter vouchers into Transaction Master (columns A–P), set Flag and Recovered From Old?, add Remarks for anything unusual, escalate SHARED items same-day.

Role	Responsibilities
Accounts Team	Maintain Settings, Chart of Accounts and Old Projects Master; review the Dashboard weekly; resolve Adjustment Journals; enter bank/cash opening and actual balances; raise project cost recovery invoices; make the Balance Sheet P&L link.
Reviewer / Sign-off	Confirm every Dashboard check is zero (or explained) before declaring a period's books fully segregated; retain the Adjustment Journals register as the audit trail.

Part 8 — Frequently Asked Questions

What date range should I import from Tally?

Two separate pulls: an opening snapshot as on 31-Dec-2025 (Trial Balance, Stock, Receivables/Payables — this is where the Old Projects Master values come from), and the full transaction range 01-Jan-2026 to 11-Jul-2026 for the Day Book, Ledger, Bank Book and Cash Book. Full detail and a sheet-by-sheet table is under Sheets 02–09 in Part 3. Confirm with Accounts whether 11-Jul-2026 itself is included in this workbook or is the first day of the New Company's independent books.

Why does the same amount sometimes need two rows in Transaction Master?

Because real accounting is double-entry — every voucher affects at least two ledgers (e.g. an expense and a bank account). Each ledger gets its own row, linked by a shared Voucher Number, so the Trial Balance can prove the books balance.

What if a voucher relates to more than one project?

Split it into separate rows, one per project, with the amount apportioned and a note in Remarks explaining the split.

Can I just delete a wrong entry and retype it?

No — for anything already reviewed or past a closed period, log a correcting entry instead and leave the original row untouched, so there's a clear record of what changed and why. For a same-day, not-yet-reviewed typo, a direct correction is fine.

Why is 'Recovered From Old?' separate from 'Flag'?

Flag says who the cost legally belongs to (Rule 5: an Old project's direct cost is always OLD, regardless of who paid it). Recovered From Old? separately tracks whether that cost has actually been reimbursed yet if the New Company paid for it — this is what drives the Intercompany Ledger and Project Cost Recovery sheets.

What happens after 11 July 2026 (the Segregation Date)?

From that date, new transactions should be entered directly into each company's own independent books going forward. This workbook's job is to cleanly close out the mixed period up to that date; it is not meant to be the permanent, ongoing accounting system for either company.

Do I need Power Query or Pivot Tables to use this workbook?

No. Every report already updates live from formulas. Pivot Tables are only useful if you want extra, ad-hoc ways to slice the Transaction Master data yourself — insert one directly on the 'tbl_Txn' table any time you like.

Appendix — Named Ranges Reference

Named range	Points to	Used for
OLD_PROJECTS	01 Settings — Old Projects Master, Project Name column	Old Project?/New Project? matching
SEG_DATE	01 Settings — Segregation Date cell	Reference date
COA_LEDGER / COA_CLASS / COA_COMPANY / COA_OVERHEAD	10 Chart of Accounts columns	Ledger classification lookups
TXN_DATE ... TXN_BAL (22 names)	11 Transaction Master, one per column, full 100,000-row range	Every SUMIFS/COUNTIFS/MATCH formula across the workbook reads through these rather than sheet+cell references

Why named ranges matter here:

Every report sheet formula references TXN_LEDGER, TXN_FLAG, etc. instead of '11 Transaction Master'!\$D\$6:\$D\$100000 directly. If you ever need to move or restructure Transaction Master, you only need to update the named ranges (Formulas > Name Manager) once, rather than hunting through every downstream formula.
