

APPLETREE ERP — DEPARTMENT GUIDES

(UAT / Demo version — see [APPLETREE_ERP_SOP.md](#) for full detail on every process named below)

A. MANAGEMENT (CEO / Directors)

Daily/as-needed: review pending high-value approvals (large POs, large discounts, payment executions above the Finance Manager tier); check the SOP Compliance Dashboard for anything newly flagged.

Weekly: review Project 360 for major projects; review the Audit Log if anything seems unusual. **Monthly:** review Company P&L and Balance Sheet; review the Cash Control Exceptions report and Seller Cumulative / 194Q report. **Important checks:** you are the ONLY role (with Admin) that can approve the Payment Approval Matrix itself — never delegate this. **Reports used:** Company P&L, Balance Sheet, SOP Compliance Dashboard, Project 360. **Approvals:** POs above Rs.20,00,000; quotation discounts above 10%; Payment Approval Matrix (Board-level); payment execution as a genuine third person when needed. **Common mistakes to avoid:** approving your own submitted document just because you have the authority to — the system will block self-approval on most workflows even for CEO in some cases; use a genuinely separate approver where the rule requires it.

B. ACCOUNTS

Daily: check pending approvals relevant to Accounts; check new supplier invoices for correctness before posting; check payments and receipts recorded that day; check clearing status on invoices you expect to be settled. **Weekly:** review AR/AP Ageing; review reconciliation for any exceptions. **Monthly:** full Reconciliation (AR, AP, Output/Input Tax, Customer Advances); Bank Reconciliation; TDS deduction review; month-end checklist (see [APPLETREE_ERP_MONTH_END_CHECKLIST.md](#)). **Important checks:** every journal entry balances (Debit = Credit) before submitting; every supplier bill has a genuine PO/GRN match or an authorized exception; no duplicate bill against the same GRN. **Reports used:** Trial Balance, General Ledger, Customer/Supplier Ledger, AR/AP Ageing, Reconciliation, ITC Reversal Report. **Approvals:** Accountant does not hold approval-tier authority in this ERP — you create/submit, Finance Manager or CEO approves/posts. **Common mistakes:** entering the ordered quantity on a bill instead of what a GRN actually recorded; forcing a receipt to match the wrong invoice when it should be a Customer Advance instead.

C. PURCHASE

Daily: check open PRs awaiting your action; check PO approval status; check pending GRNs for POs that have delivered. **Weekly:** review Procurement Intelligence and Vendor Rating. **Important checks:** never enter the PO's ordered quantity on a GRN — always enter the real received quantity; check the vendor is active before ordering; check for an existing PO before creating a new one. **Reports used:** Purchase Orders list, Procurement Intelligence, Vendor Rating, Purchase & Vendor Report. **Approvals:** you raise PRs and POs; you do not approve your own. **Common mistakes:** skipping weighment entry on genuinely weighed/bulk material; dispatching Job Work to an unregistered job worker without checking

APOB requirements first.

D. SALES

Daily: follow up on Leads assigned to you; check quotation approval status. **Weekly:** review your assigned customers' outstanding balances (AR Ageing, filtered to your customers where visible).

Important checks: always confirm which costing version a quotation is built from; keep discount requests honest — going over 5%/10% genuinely needs the next approval tier, don't try to structure around it.

Reports used: Quotations list, Customer Profitability (After-Sales area). **Approvals:** none — Sales

creates, Finance Manager/CEO approves discounts above the no-approval tier. **Common mistakes:** quoting the wrong customer when you have more than one assigned; creating a brand-new quotation for a revision instead of using the proper Revision function (which correctly keeps history).

E. ESTIMATION

Daily: work through estimation requests assigned to you. **Important checks:** every costing line (Material/Labour/Transport/Installation/Other) is complete before handing to Sales; Overhead % and Profit % reflect real company policy, not guesswork. **Reports used:** Estimation & Costing screen itself; no separate dedicated report beyond this. **Approvals:** none. **Common mistakes:** letting Sales quote from an incomplete or outdated costing version instead of the latest one.

F. PROJECT MANAGEMENT

Daily: check your assigned projects' status; check for any Material Requirement awaiting your approval.

Weekly: review Project 360 for material consumption, labour, and expenses against budget. **Monthly:** review project profitability (Project P&L) and the BOQ/BOM Variance report for abnormal consumption.

Important checks: you can only act on YOUR assigned projects — if you can't see a project you expect to, check your assignment with Admin, don't assume it's a bug. **Reports used:** Project 360, Project Financial 360, BOQ/BOM Variance, Weekly Scorecard. **Approvals:** Material Requirements for your own projects. **Common mistakes:** confusing "Committed" (open PO value) with real Actual Cost when reporting project status upward.

G. SITE (Site In-charge)

Daily: raise MRS for material needed; record site receipts against Delivery Challans as material arrives; record consumption as material is actually used. **Weekly:** submit the Site Material Reconciliation review for your site; investigate and explain any variance beyond the configured tolerance. **Important checks:** never record all sent material as consumed on arrival — only what's genuinely used; always record a receipt discrepancy if the physical count doesn't match the Delivery Challan. **Reports used:** Site Material Reconciliation. **Approvals:** your own site's MRS/petty purchases, but only within the configured site-petty daily limit (currently Rs.5,000) — above that, escalate. **Common mistakes:** approving your own MRS when its value is actually above the site-petty limit (the system should block this, but don't rely on it —

check the estimate yourself first).

H. STORE

(This ERP currently has no separate "Store" login role — store/warehouse functions like GRN and Material Issue are performed under the Purchase role. If Apple Tree wants a distinct Store role with narrower permissions, that is a Management decision not yet implemented.)

Daily: check receipts (GRN) against physical deliveries; check outgoing issues match real requests; check returns are recorded promptly; check stock counts are accurate. **Important checks:** physically count before entering a GRN's accepted quantity — never just copy the PO's ordered quantity. **Reports used:** Stock Report, Stock by Location, Movement Ledger. **Common mistakes:** letting stock counts lag behind actual physical movement, making later reconciliation harder.

I. FACTORY

(This ERP currently has no separate "Factory" login role — factory/manufacturing functions are performed under the Purchase or Project Manager role, depending on the task. A dedicated Factory role, if wanted, is a Management decision not yet implemented.)

Daily: update Job Card status; check Machine availability; issue material against Production Orders using the BOM-derived quantity. **Weekly:** review the Factory Dashboard and Production Schedule. **Reports used:** Factory Dashboard, Job Analysis, Job Cost Sheet, Product Costing, Labour Performance. **Common mistakes:** issuing more material to a Production Order than its BOM actually calls for, without the required manager-tier authorization.

J. SERVICE / AFTER-SALES

Daily: triage new complaints into tickets; schedule and complete service visits. **Important checks:** correctly classify a visit as Warranty vs. Chargeable before billing — this determines whether it costs the customer anything. **Reports used:** Customer 360, Repeat Complaint History. **Approvals:** CAPA requires three genuinely different people (owner, verifier, effectiveness-approver) — never let one person play more than one of these roles. **Common mistakes:** closing a CAPA case before its Effectiveness Check has actually confirmed the fix worked.

K. ADMIN

Daily (in UAT): support testers — reset UAT data between test rounds if requested, create/manage user accounts, seed the Demo Scenario for new testers. **Important checks:** every user has the correct role for their real job — no one should have more access than they need; only create test users, never real credentials, in this UAT environment. **Reports used:** Audit Log, Users & Roles. **Approvals:** system-wide, but should be used sparingly to override normal SoD — every override is logged. **Common mistakes:** using Admin/CEO's SoD-exemption as a routine shortcut rather than reserving it for genuine exceptions.
