

APPLETREE ERP — COMPLETE MODULE-BY- MODULE USER MANUAL

Every module, every screen, its full navigation hierarchy, key fields, step-by-step procedures, and business rules — verified against the live system, not assumed.

Updated 2026-09-19

Reference document · UAT / Demo Environment

Companion documents: *APPLETREE_ERP_USER_MANUAL.md* (quick guide) ·

APPLETREE_ERP_SOP.md (official procedure)

Contents

PART 1 — THE FULL NAVIGATION HIERARCHY

PART 2 — ROLES AND WHAT THEY SEE

PART 3 — HOME

- Dashboard

PART 4 — SALES & CRM

- Leads

- Quotations

PART 5 — ESTIMATION & COSTING

- Estimation & Costing

- BOM (Bill of Materials)

- BOM Consumption Report

PART 6 — PROJECTS

- Projects

- Project 360

- Budget vs Commitment vs Actual

- Change Requests (Variations)

PART 7 — PROCUREMENT

- Purchase Requisitions

- Material Requirements (MRQ)

- Material Requests (MR)

- RFQs → Supplier Quotations → Comparisons

- Purchase Orders

- GRNs (Goods Receipt Note)

- Payment Requests

- Site Material

- Procurement Intelligence, Replenishment Recommendation, Vendor Rating, Vendor-wise Purchase Report

PART 8 — INVENTORY

- Stock

- Movement Ledger

- Transfer

- Adjustment

- Material Issues

- Material Return (Site)

- Purchase Returns

- Damage Reports

- Stock Report, Locations, Stock by Location, Material Analysis

- Stock Counts

PART 9 — SITE OPERATIONS

- Labour & Wages
- Labour Cost Analysis
- Project Expenses
- QC Dashboard
- Project Timesheet
- Tasks
- Risk Register
- Weekly Scorecard
- Site Material

PART 10 — PRODUCTION & JOB WORK

- Production Orders
- Factory Dashboard
- Machines
- Job Cards
- Production Schedule, Job Analysis, Job Cost Sheet, Product Costing, Labour Performance
- Job Work

PART 11 — EXECUTION & DELIVERY

- Dispatch
- Delivery
- Installation
- QC (Quality Control)
- Snags
- Handover
- Billing Milestones

PART 12 — FINANCE

- Document Workflow
- New Journal Voucher
- Customer Invoice
- Customer Receipt
- Customer Credit/Debit Note
- Supplier Bill
- Supplier Payment
- Customer Advance
- Journal Templates / Recurring Entries
- Import (CSV)
- Journal Register
- Document Viewer
- Bank Reconciliation / ICICI Bank Import
- Reconciliation
- Financial Periods
- Fixed Assets
- Bank / Cash Transfer

- Supplier Debit Note
- Master Data Import
- Opening Balances
- Compliance Dashboard
- SOP Configuration
- Payment Requests
- Petty Cash
- APOB & E-way Bill
- ITC / BOQ Reports
- TDS Reporting

PART 13 — FINANCIAL STATEMENTS

PART 14 — SERVICE & AFTER-SALES

- Customer 360 / Customer Profitability
- Warranty
- Complaints → Service Tickets → Service Visits
- AMC (Annual Maintenance Contract) → AMC Schedule → Service Billing
- CAPA

PART 15 — REPORTS & ANALYTICS

PART 16 — MASTER DATA

PART 17 — ADMINISTRATION

- Policy Configuration
- Users & Roles
- Try Unauthorized Action

PART 18 — THE RULES THAT APPLY EVERYWHERE

PART 19 — IF SOMETHING GOES WRONG

Updated 2026-09-19. This is the detailed, structural reference manual — organized exactly the way the system's own left-hand menu is organized, module by module, screen by screen, with the full navigation hierarchy, who can see what, what every screen actually does, its key fields, the step-by-step procedure, and the business rules behind it.

How this relates to the other manuals in this folder: - `APPLETREE_ERP_USER_MANUAL.md` — a short, plain-English "how do I do X" guide for everyday staff. - `APPLETREE_ERP_SOP.md` — the official Standard Operating Procedure, organized by business PROCESS (60 parts) rather than by screen, with the formally approved rules (approval tiers, cash limits, etc.) and end-to-end worked examples. - **This document** — the complete structural reference: every module, every screen, in the order they appear on screen, with real depth per screen. Use this one when you want to understand exactly what a specific screen does, or to see the whole system's shape at a glance.

Nothing in this document is invented — every screen, field, rule, and status named here was verified directly against the live system's own code and, where noted, against real test evidence from this engagement's testing history.

PART 1 — THE FULL NAVIGATION HIERARCHY

The system organizes every screen into 15 module groups, shown down the left side of the screen. This is the complete, current tree:

(Backup / Restore exists but has NO screen – see Part 15.)

PART 2 — ROLES AND WHAT THEY SEE

There are 10 roles. Two (Admin, CEO) see every module. The other 8 each see a curated subset — this is a *convenience filter only*, not the real security boundary; the real security check happens on the server every time, regardless of what your menu shows.

Role	Modules visible in the menu
Admin	Everything
CEO	Everything
Accountant	Home, Finance, Financial Statements, Reports & Analytics
Finance Manager	Home, Finance, Financial Statements, Reports & Analytics, Master Data, Procurement, Projects
Project Manager	Home, Sales & CRM, Estimation & Costing, Projects, Procurement, Site Operations, Execution & Delivery, Inventory, Service & After-Sales, Reports & Analytics
Purchase	Home, Procurement, Inventory, Production & Job Work, Reports & Analytics
Sales	Home, Sales & CRM, Projects, Service & After-Sales, Reports & Analytics
Estimator	Home, Sales & CRM, Estimation & Costing, Projects
Site In-charge	Home, Projects, Site Operations, Execution & Delivery, Inventory, Service & After-Sales
Viewer	Home, Projects, Financial Statements, Reports & Analytics (read-only everywhere)

If a screen you need isn't on your menu, that's usually intentional for your role — check with whoever manages the system rather than assuming it's missing.

PART 3 — HOME

Dashboard

Purpose: Your landing page after login — a role-aware summary (e.g., open items relevant to you). **Who:** Everyone. **How to use it:** Nothing to fill in — just read it. It's your starting point every day.

PART 4 — SALES & CRM

This is where every job begins — turning an enquiry into a priced, approved offer.

Leads

Purpose: The very first record of a potential customer/job. **Who:** Sales, Estimator (view), Admin, CEO. **Key fields:** Name, contact details, site address, what they want (requirement), expected value, next follow-up date. **Steps:** 1. Click to add a new Lead. Fill in the fields above. 2. The Lead starts at status **NEW**. 3. When you're ready to size the job, click the one-click **Create Estimation Request** action on the Lead's own row — this automatically moves the Lead's status to **ESTIMATION** and hands it to Estimation & Costing. **Rules:** A Lead's status moves forward automatically as the deal progresses (NEW → ESTIMATION → QUOTATION → WON, or LOST at any point) — you don't set this manually.

Quotations

Purpose: The customer-facing priced offer, built from an Estimator's Costing Version. **Who:** Sales creates/submits; Finance Manager or CEO approves discounts above the free tier; Estimator/Accountant/FinanceManager/CEO/Viewer can view. **Key fields:** Which Costing Version to price from, prospect/customer name, discount %, validity days, payment terms. **Steps:** 1. Pick the Costing Version prepared for this Lead's Estimation Request. 2. Enter a discount % if applicable. The system calculates the final price automatically ($\text{sellingPrice} \times (1 - \text{discount\%})$). 3. Click **Submit**. 4. If the discount is **5% or less**, it auto-approves immediately. Above 5% and up to 10%, a **Finance Manager** must approve. Above 10%, the **CEO** must approve. You cannot approve your own quotation's discount, regardless of your role. 5. Once approved, record the customer's **Acceptance** (currently a manual record — there is no e-signature integration yet, this is a disclosed, known gap, not a bug). 6. Click **Mark Won**. This is the single most important button in this screen: it creates a real Project, finds-or-creates the real Customer record, assigns a Project Manager, and freezes a Cost Baseline — all in one atomic step. It cannot be clicked twice for the same Quotation (a duplicate attempt is correctly rejected, live-proven in this engagement's own testing). **Rules:** A Quotation cannot mix a Lead, Estimation Request, and Costing Version from unrelated chains — the system checks the three references genuinely belong together before allowing creation (this exact check was added after a real defect, DEF-P41-01, was found and fixed in this engagement). Until a Quotation is Won, **zero accounting entries exist anywhere** for that deal — creating a Lead, an Estimation Request, a Costing Version, or even a Submitted/Approved Quotation never touches the General Ledger. Only a posted Customer Invoice, much later, does.

PART 5 — ESTIMATION & COSTING

Estimation & Costing

Purpose: Where an Estimator works out the real cost of a job and the price it should sell for. **Who:** Estimator creates; Sales/Accountant/FinanceManager/CEO can view (Sales only ever sees the final selling price, never the internal cost breakdown — a deliberate field-level security rule). **Key fields:** Material lines (each with quantity and rate), Labour cost, Transport cost, Installation cost, Other cost, Overhead %, Profit %. **Steps:** 1. Open the Estimation Request that Sales sent you. 2. Add your material lines — the system totals them into a Material Cost automatically. 3. Enter Labour/Transport/Installation/Other costs — these are job-level, charged once per costing, not multiplied per line item. 4. Enter your Overhead % (added on top of the base cost) and Profit % (applied after overhead) — the system computes the final Selling Price for you: $((\text{baseCost}) \times (1+\text{overhead\%})) \times (1+\text{profit\%})$. 5. Save — this becomes a **Costing Version**. You can create more than one version for the same Estimation Request if you want to compare different approaches; each is numbered and kept. **Rules:** Quantity and rate must both be greater than zero on every line; overhead % cannot be negative; profit must be a real, finite number.

BOM (Bill of Materials)

Purpose: Defines exactly what materials (and how much of each) go into making something. **Who:** Purchase/Admin typically create; the workflow requires a second person to approve. **Key fields:** Project, description, lines (material, quantity, unit, scrap %). **Steps:** 1. Create the BOM with at least one line — an empty BOM cannot be created (this closes an old defect where a zero-item BOM could be waved through as complete). 2. **Submit** it. 3. A different, authorized person clicks **Approve** — only a Submitted BOM can be approved; you cannot approve straight from Draft (this exact Draft→Submitted→Approved discipline was added as a fix in this engagement, closing a real UI navigation gap). **Rules:** Only an Approved BOM can be referenced by a real Production Order.

BOM Consumption Report

Purpose: Read-only comparison of what a BOM said should be used vs. what was actually consumed. **Who:** Anyone with Manufacturing/Production visibility. **How to use it:** Pick a project, read the variance.

PART 6 — PROJECTS

Projects

Purpose: The master list of every real, Won project. **Who:** Everyone with Projects visibility (scope varies — a Project Manager sees only projects they're assigned to; CEO/Admin/FinanceManager see all). **How to use it:** Click any row to open its detail.

Project 360

Purpose: The single richest screen in the whole system for understanding one project — budget, committed value, actual spend, customer, QC status, and a **Document Flow** panel that assembles every connected document for that project into one chain, in both directions: - **Forward (sales origin):** Lead → Estimation Request → Costing Version → Quotation → this Project. - **Forward (execution/settlement):** Purchase Requisition → Purchase Order → GRN → Supplier Bill → Payment Request → Supplier Payment → Clearing; and Customer Invoice → Customer Receipt → Clearing. - Also covers Site Material Requisition → Delivery Challan → Site Material Receipt, and Job Work Orders. **Who:** Project Manager (own projects), FinanceManager, CEO, Admin, Sales (own leads' projects). **How to use it:** Pick a project from the dropdown/list; everything renders automatically. You never need to remember or type a document number — click through the chain instead.

Budget vs Commitment vs Actual

Purpose: Read-only report — budget, what's been ordered/committed, and what's actually been spent, side by side for a chosen project.

Change Requests (Variations)

Purpose: Tracks scope changes a customer asks for mid-project, separately from the original Quotation, with their own cost impact. **Steps:** Create a Change Request describing what changed and its value; it's tracked against the project without altering the original baseline numbers.

PART 7 — PROCUREMENT

Purchase Requisitions

Purpose: An internal "we need to buy this" request, raised before a Purchase Order, for planned or larger needs. **Steps:** Create it describing what's needed and why; it goes through its own approval before it can be referenced on a real PO. Optional for small/urgent buys, recommended for anything significant.

Material Requirements (MRQ)

Purpose: Shows the calculated material demand that comes out of an approved BOM — how much of what material is needed, for which project. Read-only/computed, not something you create by hand. **Note:** "Material Requirements" (MRQ) and "Material Requests" (MR) are two DIFFERENT, real documents with deliberately similar names — MRQ is the calculated need; MR is the actual bundled request you raise to go buy it. This naming similarity is a known, disclosed point of confusion (tracked as an open item pending a business decision on renaming), but the two documents themselves work correctly and are not the same thing.

Material Requests (MR)

Purpose: Bundles approved Material Requirements into concrete lines that an RFQ or PO can be raised against. **Steps:** Create it referencing the Requirements it covers; this becomes the actual procurement trigger document.

RFQs → Supplier Quotations → Comparisons

Purpose: The formal sourcing chain. **Steps:** 1. Create an **RFQ** (Request for Quotation) for the material/service you need. 2. Send it to one or more suppliers; record what each quotes back under **Supplier Quotations**. 3. Open **Comparisons** to see all the quotes side by side (price, lead time, terms) before deciding.

Purchase Orders

Purpose: The formal, legally-binding order to a supplier. **Key fields:** Supplier, project, lines (material, quantity, rate, UOM). **Steps:** 1. Create the PO. 2. **Submit** it. 3. Approval tier depends on value: **up to ₹5,00,000** it auto-approves; **₹5,00,000 to ₹20,00,000** requires a **Finance Manager**; **above ₹20,00,000** requires the **CEO** (thresholds are Appletree's own approved SOP values, not invented here). **Rules:** A negative-quantity line is rejected outright, with zero PO record created.

GRNs (Goods Receipt Note)

Purpose: Records what actually physically arrived against a PO. **Steps:** Open the PO, enter the quantity actually received per line (accepted and rejected separately if there's a quality issue) and the warehouse it went into. You can record a partial delivery and come back later for the rest — the system tracks cumulative received quantity against the PO's own ordered quantity, so it never over-receives past what was ordered.

Rules: A negative-quantity GRN line is rejected, leaving the PO's received-quantity totals completely unchanged.

Payment Requests

Purpose: For a Supplier Payment that needs an extra layer of control beyond the everyday Supplier Payment screen — a real, enforced three-person separation. **Steps:** 1. **Maker** (typically Purchase) raises the request against a real, existing Supplier Bill. 2. **Checker** (typically Finance Manager) approves it. The maker cannot also be the checker. 3. **Executor** actually releases the payment. A non-CEO/Admin checker cannot also execute the SAME request they just approved — a genuinely different third person is required. CEO and Admin are the only roles exempted from needing a distinct third person, by explicit design.

Site Material

See **PART 8 — SITE OPERATIONS** below (this screen is shared between the Procurement and Site Operations menus because Purchase is the role that actually issues material from the warehouse).

Procurement Intelligence, Replenishment Recommendation, Vendor Rating, Vendor-wise Purchase Report

Purpose: Read-only analytics — spend by vendor, suggested reorder points, a 0-100 vendor performance score, and a filterable purchase-history report by vendor. **How to use them:** Open, pick filters if offered, read the numbers. Nothing to submit.

PART 8 — INVENTORY

Stock

Purpose: Current on-hand quantity and Moving-Average cost, per warehouse. Read-only.

Movement Ledger

Purpose: Every single stock movement (in or out) in chronological order — the audit trail for "what happened to this material."

Transfer

Purpose: Move stock between two of your own warehouses. **Steps:** Pick source and destination warehouse, material, and quantity.

Adjustment

Purpose: Correct a stock quantity that's simply wrong (e.g., a physical count found a discrepancy). **Steps:** Enter the material, warehouse, and the correction — a reason is required, this is not a silent override.

Material Issues

Purpose: Record material actually consumed on a project. **This is the one and only event that turns purchased/held material into a real project cost** — buying material or receiving a GRN does NOT cost the project anything by itself. **Steps:** Pick project, material, warehouse, quantity — post it.

Material Return (Site)

Purpose: Material coming back from a site to a warehouse — an internal custody transfer, NOT a return to a vendor. A "Damaged"/"Lost" line writes off value instead of returning it to stock. **When NOT to use:** For returning something to a supplier, use Purchase Returns instead.

Purchase Returns

Purpose: A vendor-facing return against a specific GRN line — reduces what you owe that supplier.

Damage Reports

Purpose: Record damaged material with a reason and the value being written off.

Stock Report, Locations, Stock by Location, Material Analysis

Purpose: Read-only reports slicing stock quantity/value by different dimensions (location, material, etc.).

Stock Counts

Purpose: Record a physical count and let the system show you the variance against book quantity. **Steps:** Enter what you physically counted; the variance shown can then be turned into an Adjustment (above) to correct the books.

PART 9 — SITE OPERATIONS

Labour & Wages

Purpose: Record labour cost for a project — this posts a real accounting entry (Dr Labour Cost / Cr Bank or Payable, account 5100), it's not just a log. **Key fields:** Project, worker name, role, days, rate per day, date.

Labour Cost Analysis

Purpose: Read-only summary report of labour cost.

Project Expenses

Purpose: Record any other direct project cost that isn't labour or material.

QC Dashboard

Purpose: A per-project count of how many Quality Checklists are Passed, Failed, or still Pending/In-Progress — a fast health check across every project. Read-only. **Note:** This screen previously had a real bug (it read a field that was never actually being written, so it always showed every checklist as "Pending" regardless of its true result) — this was found, fixed, and re-verified as **DEF-2026-001**, closed. It now correctly reads each checklist's real status.

Project Timesheet

Purpose: Log hours worked per worker per day — pure time-tracking, separate from Labour & Wages and with no accounting effect of its own.

Tasks

Purpose: A simple project to-do list. Create, assign, mark Done.

Risk Register

Purpose: Log a project risk with likelihood and impact — severity is calculated automatically (likelihood × impact), not typed in by hand. Close it once it's no longer a concern.

Weekly Scorecard

Purpose: Capture a weekly snapshot of key project numbers for trend tracking.

Site Material

Purpose: The full chain of getting material from a warehouse to a project site. **Steps:** 1. **Create the Site** once (name, address, state). 2. **Raise an MRS** (Material Requisition — Site) — the site, project, material, and quantity needed. 3. **Submit** the MRS. 4. Purchase (or FinanceManager/CEO/Admin) **Approves** it — the

server-side rejection message names exactly who's authorized, per Appletree's own SOP §8. 5. Purchase **Issues** it from a warehouse — this automatically creates a **Delivery Challan** (the transporter/vehicle document) and a real inventory movement. 6. When it physically arrives at site, **Record the Site Receipt** against that Delivery Challan. 7. When it's actually used on the job, **Record Site Consumption** — exactly like Material Issues above, this is the moment it becomes a real project cost. **Rules:** An MRS references a specific site and project — you cannot confuse it with a Purchase Requisition (a different, procurement-facing document) or with the calculated Material Requirement/ Request pair above.

PART 10 — PRODUCTION & JOB WORK

Production Orders

Purpose: Tracks actually manufacturing something against an Approved BOM. **Steps:** Create it referencing the BOM and how many units you're making; it moves through its own lifecycle (Draft → Released → In Progress → Partially Completed → Completed/Closed, or Hold/Cancel).

Factory Dashboard

Purpose: Read-only overview of what's currently in production.

Machines

Purpose: Register the machines you use; each shows Available or In Use, updated automatically when a Job Card against it is started.

Job Cards

Purpose: Tracks one production step (e.g., "Cutting") against a Production Order. **Steps:** Create it — pick the Production Order, the operation, the machine, and the assigned worker. **Start** it — this also marks the machine In Use.

Production Schedule, Job Analysis, Job Cost Sheet, Product Costing, Labour Performance

Purpose: Read-only reports on scheduling, per-job cost (material + labour + total actual cost), product-level costing, and labour performance.

Job Work

Purpose: Sending material to an outside processor (a "Job Worker") for work you don't do in-house, and getting it back. **Steps:** 1. Add the processor as a **Job Worker** — mark whether they're GST-registered (this genuinely changes what's legally required next). 2. **Dispatch** material to them. You can add several different materials to one dispatch with "+ Add Material" — each line is then tracked and can be returned/scrapped independently of the other lines on the same dispatch. 3. When material comes back, record the **Return** — partial returns are fine, come back for the rest later; an over-return beyond what was actually dispatched is rejected. 4. If material became scrap at the job worker's site, record it separately with a reason — scrapped material never re-enters your warehouse stock (it's correctly excluded, not silently re-added). 5. If finished goods go straight to your customer from the job worker's premises (**Direct Dispatch**), and the job worker is **unregistered**, you must first have an active **APOB** declaration on file (see Finance below) — the system will refuse the dispatch otherwise.

PART 11 — EXECUTION & DELIVERY

Dispatch

Purpose: Marks a completed Production Order ready for release to the customer. Posts zero inventory/GL value by itself — it's a tracking/readiness event, not a financial transaction.

Delivery

Purpose: Records the customer actually receiving what was dispatched. Supports partial deliveries against one Dispatch — the system tracks cumulative delivered quantity, so it correctly blocks over-delivery and blocks marking something "fully delivered" twice.

Installation

Purpose: Tracks on-site fit-out labour/installation execution. Posts labour cost to a dedicated Cost Centre (CC-INSTALLATION).

QC (Quality Control)

Purpose: The formal inspection record for a project. **Steps:** 1. Create a checklist with at least one item — an empty checklist cannot be created (closes a real defect where a zero-item checklist could be waved through as "Passed" with nothing actually inspected). 2. Mark each item **Pass** or **Fail**; flag any item **Critical** if a failure there should fail the whole checklist regardless of the other items. 3. **Submit**. The checklist becomes: **Passed** (every item passed), **Failed** (any critical item failed), or stays **In Progress** (some items still unmarked). A checklist starts as **Pending** before its first submission. **Rules:** QC status directly gates whether Handover can succeed (see below) — there is no way to skip this step for a project that needs it.

Snags

Purpose: Log a defect found during QC or installation. **Steps:** Create it with a severity (Critical/Major/Minor), **Assign** it to someone, they **Resolve** it, then a genuinely **different** person **Verifies** it before it can be **Closed** — the person who fixed it cannot also sign off that it's fixed (except CEO/Admin, who are exempted from this specific check).

Handover

Purpose: The final customer sign-off event. **Rules (all enforced server-side, not just suggested):** - Installation must be marked **Completed**. - At least one QC checklist must exist and be **Passed** (having zero QC records is NOT treated as "passed" — this exact fail-closed behavior was a real fix made during this engagement's own testing, after finding the original logic incorrectly treated "no QC yet" as equivalent to "QC passed"). - Zero **open Critical Snags** may remain. If any condition isn't met, the screen states exactly which one is missing. A project can only be successfully handed over **once** — a second attempt on an already-handed-over project is correctly rejected, with no duplicate record and no duplicate audit entry created (live-proven in this engagement's own testing, `erp_audit_p0_tests.js` ERP-034).

Billing Milestones

Purpose: A manually-reviewed trigger point (Advance / Production / Dispatch / Delivery / Installation / Handover / Final Billing) that unlocks the ABILITY to raise an invoice — it never creates one automatically.

Steps: Mark the milestone **Ready** (requires finance-tier permission); Finance can then go raise the actual Customer Invoice from the Finance module.

PART 12 — FINANCE

Document Workflow

Purpose: Your personal queue of draft accounting documents waiting for the next step (Submit, Approve, or Post).

New Journal Voucher

Purpose: A manual accounting entry for anything that doesn't fit one of the dedicated screens below. **Steps:** Enter your debit and credit lines — they must balance exactly (total debit = total credit) or the system rejects it outright, with zero entries created. Submit → a different person Approves → Post.

Customer Invoice

Purpose: Bill a customer for real, posted revenue. **Steps:** Pick project and customer, enter the amount and tax code, Submit → Approve → Post. This is the step that actually moves the Trial Balance — nothing before it (Lead, Estimation, Quotation, even a Won Project) touches the General Ledger at all.

Customer Receipt

Purpose: Record a customer's payment against a posted Invoice — this "clears" it, fully or partially, and creates a real Clearing record you can trace in the Document Viewer.

Customer Credit/Debit Note

Purpose: Adjust a customer's balance without raising a full new invoice.

Supplier Bill

Purpose: Enter what a vendor billed you. For material purchases, this is checked against the PO and the GRN — a genuine 3-way match — before it's allowed to post.

Supplier Payment

Purpose: Pay a vendor directly, clearing their bill fully or partially. For larger amounts, use Payment Requests (Procurement) instead, for the extra 3-person control.

Customer Advance

Purpose: Record money received from a customer before any invoice exists — sits as a liability until applied against a real, later invoice.

Journal Templates / Recurring Entries

Purpose: Save a Journal Voucher pattern you use often, or schedule one to post automatically on a repeating basis.

Import (CSV)

Purpose: Bulk-load Journal Vouchers from a spreadsheet. **Rules:** The whole file is validated FIRST. If even one row is invalid, **nothing** in the file gets posted — true all-or-nothing atomicity, not a partial commit. A "dry run" option lets you check a file without posting anything at all.

Journal Register

Purpose: The full, searchable list of every posted accounting entry.

Document Viewer

Purpose: Type in any document ID (e.g., a Journal Voucher number) and see its complete detail — every line, every amount, its project/cost-centre/tax tags, and — if it was cleared — the exact Payment or Receipt entry that cleared it.

Bank Reconciliation / ICICI Bank Import

Purpose: Bring in a bank statement, match each line against the books, mark it reconciled. **Rules:** Re-importing the exact same statement is detected and flagged as duplicate, not silently re-imported a second time. A statement account number that doesn't match the configured bank account is flagged (not silently accepted or silently blocked).

Reconciliation

Purpose: Checks that customer/vendor running subledger balances genuinely match the General Ledger control accounts — open it and read the result.

Financial Periods

Purpose: Open and close accounting periods. Once closed, new entries can't be dated into that period.

Fixed Assets

Purpose: Register a company asset, track its depreciation, and record its eventual disposal. **Steps:** Capitalize the asset (its cost and date) — posts a real GL entry (Dr Fixed Asset / Cr Bank or Payable). Run **Depreciate** periodically. When it's sold or scrapped, **Dispose** it — the gain-or-loss vs. its Net Book Value is calculated for you automatically, not typed in by hand. **Rules:** An already-Disposed asset cannot be disposed again; only Admin/CEO/FinanceManager-tier roles can dispose an asset (Purchase, for example, is correctly blocked).

Bank / Cash Transfer

Purpose: Move money between two of your own bank/cash accounts.

Supplier Debit Note

Purpose: The vendor-facing equivalent of Customer Credit/Debit Note.

Master Data Import

Purpose: Bulk-load master records (customers, vendors, materials, etc.) — same all-or-nothing safety as the Journal Voucher import above.

Opening Balances

Purpose: One-time entry of starting account balances when first moving onto this system.

Compliance Dashboard

Purpose: A single, honest screen showing everything still outstanding for full SOP compliance — configuration items still needed, decisions still pending. It never shows a false "100% done."

SOP Configuration

Purpose: Where an Admin sets the actual numeric rules behind the system (cash limits, discount approval tiers, etc.).

Payment Requests

See **PART 7 — PROCUREMENT** above (shared screen).

Petty Cash

Purpose: Manage a small cash float per site. **Rules:** Every expense from the float requires an original bill attached — no exceptions. Can be reconciled any time (checks cash-on-hand matches what the books say should be left) and replenished once vouchers accumulate.

APOB & E-way Bill

Purpose: **APOB (Additional Place of Business)** — the GST declaration required before an unregistered Job Worker can dispatch material straight to your customer from their own premises. **E-way Bill Tracking** is manual entry only — there is no live connection to the government e-way bill portal.

ITC / BOQ Reports

Purpose: Tax-credit adjustment tracking, estimated-vs-actual BOQ material use per project, which suppliers are approaching the annual statutory reporting threshold, and any cash payments that required a manager's override.

TDS Reporting

Purpose: Every TDS deduction that's happened automatically at Supplier Payment time (when a category is active and its threshold crossed), plus the running TDS-payable GL balance. **Rules:** the rates/thresholds shown are Appletree's own SOP configuration — always independently verify against current tax law before relying on this for actual filing; this is stated on-screen, not hidden.

PART 13 — FINANCIAL STATEMENTS

Balance Sheet, Company Profit & Loss, General Ledger, Customer Ledger, Supplier Ledger, Trial Balance, AR Ageing, AP Ageing. All read-only. **Trial Balance is the one to check first** whenever you want a sanity check that the books are in order — it confirms every debit has a matching credit, company-wide, at any point in time.

PART 14 — SERVICE & AFTER-SALES

Customer 360 / Customer Profitability

Purpose: Everything about one customer, and how profitable they've been across every project, in one place.

Warranty

Purpose: Record a warranty claim against a handed-over project — the system knows whether the claim falls inside the warranty period.

Complaints → Service Tickets → Service Visits

Purpose: A customer complaint becomes a Ticket, which gets one or more Visits logged against it until resolved.

AMC (Annual Maintenance Contract) → AMC Schedule → Service Billing

Purpose: Set up a maintenance contract, schedule the visits it covers, and bill it — billing goes through the exact same Customer Invoice mechanism as everything else, simply tagged with the AMC contract's ID for traceability. No separate/second billing engine exists.

CAPA

Purpose: A formal root-cause investigation for a repeat problem — what happened, why, the corrective action taken, and a required follow-up check confirming the fix actually worked (a genuine effectiveness-check gate, not just a closed checkbox).

PART 15 — REPORTS & ANALYTICS

Accounting & MIS Quick Reports, Accountant MIS, Management MIS, Cross-Dimensional Reports, Company Profitability, HSN Data Quality. All read-only reports — open, filter if offered, read.

Exports. Download data out of the system.

Audit Log. A record of every significant action, who did it, and when. Never shows a password, password hash, session token, or other secret — confirmed by direct testing.

Backup / Restore — no screen, API only. A real, fully working, SHA-256-checksummed, Admin/CEO- only backup and restore mechanism exists and has been live-proven (create → alter data → restore → exact original state returned). It deliberately has **no dedicated screen** — this mirrors how most real ERP systems treat backup/restore as an administrative/Basis-layer function, not a regular end-user screen, and is not considered a gap.

PART 16 — MASTER DATA

Branches, Profit Centres, Cost Centres, Bank Accounts, Chart of Accounts. The underlying setup data everything else references. **Rule worth knowing:** every bank/cash account needs its OWN distinct GL account code — this is how one account's balance is kept genuinely separate from every other account's, rather than everything blending into one number.

PART 17 — ADMINISTRATION

Policy Configuration

Purpose: Where approval thresholds and similar system-wide rules are actually set.

Users & Roles

Purpose: Create staff accounts, assign roles. Also hosts two special actions: - **Create Demo Scenario** — builds one complete, real, connected 15-step example chain (Project → Purchase Requisition → PO → GRN → Bill → Payment Request → Approval → Payment → Clearing → Site Material → Consumption → Project Cost) so there's something real to look at before you build your own test data. - **Reset UAT Data** — wipes everything back to a clean starting state.

Try Unauthorized Action

Purpose: A deliberate, safe testing screen — shows you exactly what an "access denied" message looks like, without anything actually going wrong.

PART 18 — THE RULES THAT APPLY EVERYWHERE

1. **You can never approve your own work.** Whoever created or raised something is never the one who approves it — enforced by the server, not just the UI, and verified by direct attempts to bypass it throughout this engagement's testing (e.g., a real click on a supposedly-hidden button, blocked anyway).
2. **Nothing posts to the accounts automatically.** Every real accounting entry needs an explicit Submit → Approve → Post by real, distinct people. Work happening (a dispatch, an installation, a handover) never silently creates an invoice or a journal entry by itself.
3. **Material only becomes a project cost when it's actually used**, not when it's bought. Buying, receiving (GRN), and even holding material in a warehouse cost the PROJECT nothing — only Material Issue / Site Consumption does.
4. **A "no" from the system is not a malfunction.** Every rejection message explains exactly why (e.g., "you can't approve your own request," "this checklist isn't Passed yet," "a BOM must be Submitted before it can be Approved") — and nothing is ever left half-done by a rejected action; a failed attempt always leaves zero partial records behind.
5. **Numbering never collides**, even under heavy simultaneous use — every document gets a genuinely unique number, proven under a 525-document same-session stress test with zero duplicates.

PART 19 — IF SOMETHING GOES WRONG

Read the on-screen message first — it almost always tells you exactly what's wrong and why. If it still seems incorrect, write down precisely what you did (which screen, which values, what happened) and report it to whoever manages the system, rather than repeating the attempt with different numbers hoping it works differently.
